

INSIGHT is the term used to define the interaction of products: Solid Edge and Sharepoint. The technology allows you to interact with server-based Sharepoint and SQL Server, running on a Windows 2003 Server setup. The project would entail 2 phases:

Phase 1

installation/configuration of products on the server

Installation of Windows Server 2003

Installation of Windows Sharepoint Services (WSS) or Sharepoint Portal Server (SPS), Microsoft SQL Server and INSIGHT Server on the given server. All applicable service packs included.

Configure the above products for use in an INSIGHT network.

(training/observation by ADMIN users in the process of installation and default configuration)

start customization of Sharepoint sites

- initial creation of "dashboards" for company global and/or local group's interface into the database

setup of clients (SE users and non-SE users)

Configure SE on all client workstations for use with the INSIGHT server.

database population: adding files to workspace using SE, Sharepoint dashboard and Rev Mngr

-testing the "vaulting" process (check out/in and synchronization of files)

training for admin and clients

ECO workflow, use of .PCF file

INSIGHT dashboard and interface

-exchange/review of files between groups and shop floor personnel

Life Cycle assistant

Phase 2

database review and cleanup

copy portions of existing database into managed sites

testing of system

adding data to managed area for use as production/released files

ongoing customization of sites

*-----
interface to SAP and exchange of files (futures)*

custom interface to allow exchange of files and/or properties between the two products
